GORDION EXCAVATIONS, 1956

Prof. Rodney S. YOUNG

During the 1956 campaign of the Uni-versi:ty of Pennsylvania Mus,eum ait Gor-dion, wor,k w:as done in three parts of the site: on the city mound proper (höyük), on the smallier mound to the southeast of it (Küçük höyük), and in the cemetery. ln addition, the ancient road which passes through the cemetery was investigated. This road, of hard - packed gravel with a CUl'.bing of stone at either side, was a two - lane highway with a width of 6.25 m. (fig. 1). Because it winds its way between the tumuli, it would seem to be later than they are and ,therefore of the post - Phrygian period, of the time either of the Persian or of the Roman Empire. As neither the course nor the cons,truction of our road resembles ,known roads of Roman times, the former seems the more probable alternative. Toward the east the road may be picked up in sevenal places, notably at Beyceğiz, where there was an ancient sett!, ement, and near the large mound (Ka-rahöyük) close to the Yenidoğan station, it seems to have passed closie to the Gor- dion höyük at the north, probably with branch roads leading to the city gates; it must have crossed the Sakary •: 1. ona bridge jnst below the city, and then followed the valley of the Porsuk westward, as the modern railroad does. This highway, lin-king sites which were of little importance in Roman times, was presumably a part of the Persian royal road system.

THE KÜÇÜK HÖYÜK

The smaller mound to the southeast of the höyük was perh:a.ps in ancient times separated from it by a branch of the Sa- karya River. Investigations made in 1952

1:1,uggested that it was a habitation mound which had been capped in the six1th century by a tumulus of clay, presumaibly over a grave; hence the odd profile of ,this smaller mound. Trenching at a bout two thirds of its height and on the south side laid bare part of a large building of kerpic reinfor- ced with a wooden framework. which had destroyed by fire ,evidently in conse- quence of a battle. The skeletons of people who had been caught in the col, lapse of the building were found under the burned debris, and throughout arrow points of bronze and of iron were found in great number, s,ome of them deeply embedd'e:1 in the kerpic of the walls. The potter-y found in the building included many lydi- ons as well as skyphoi lekythoi Of Lydian type, to be dated around the middle of the sixth century. consequence the battle was interpreted as an lepisode in the campaign of Cyrus the Great lagainst King Croesus, which terminated in the capture of Sardis in 547-6 B.C.

in the hope of finding stratified set- tlement levels under the burned Lydian building more work w:gs done in 1956. The results of this showed that the entire cent-ral part of the Küçük höyük is an artifici- ally heaped up mound of clay. The Lydian building stands on a solid plattform of terrace built of kerpic which has been followed to a depth of 12 m. 'below floor level. The full height of the terrace has been exposed only at its sou, thwesit corner, in a deep pit (fig. 2); its width at the south end was 8.50 m., and its west side has been tl-aced to a distance of 20 m. from the corner. The terrace was appro- ached from the south by a ramp also of kerpic. The lower part of the .terrace wall

seems originally to have been covered by a s,loping *glacis* of clay; subsequently, after the destruction of the Lydian building and at the time the tumulus was made, the whole was covered with clay to its full height.

Excavation to the east of the burnej building on top of the terrace \(\)1aid bare continuation; but this eastern part of the building, though it too contained a great number of bronze and iron arrow point, had not been burned. It would seem that this part of the building had been coverd with clay at some time after the battle, and before the fire which destroyed the western sectio;1. This clay layer may have been an earthwork run up for defensive purpos,es during an intervail in perhaps between first battle, unsuccessful athck and the final successful attack in which the building was destroyed. Further excavation in 19,57 may throw more light on the sequence of events;.

THE HÖYÜK

That Gordion continued to be inhabi- ted in the century and a half that elapsed between the destruction of the Phrygian city and the coming of the Persians i,..; shown not only by the monumental building of the Lydian period on the Küçük höyük, but also by a number of relativ, ely rich tombs in the cemetery, which are to be d: ted in the seventh and early sixth cen- tury. On the city mound, however, no stratum belonging to this period has been found; the thick layer of clay laid down as a bed for the new archaic city restsi directly on the burner. debri-s of the destroyed Phry- gian town. Our business in 1956 was to clear away one of the badly plundered archaic buildings, of which only the wall beds of rubble remained, in order to lay hare the Phrygt.an level below. This level was approached through the monumental fortified city gate at the southeast side of the mound, which had been cleared in the course of previous campaigns. Within the

gate laya huge open court paved with stu-ne flags; this had probably extended ori- ginally to the gate itself, but ,at some late period the paving immediately within the gate had been ripped up to make room for the insertion of an inner pylon or gateway, probably covered by a roof. Farther in a large area of the stone paving is still in-tact. Two houses of the Phrygian period front on it at the south. A cross - wal.J Of kerpii; 1.aid on top of the s,tone pavement, was a later addition which served to isolate the area of the houses from intrusion by the vulgar entering the city through its main gate just to the east. The two houses and one to the south of them which has been only partly dug, were covered by an undisturbed layer of burned debris from their own destruction, about a meter in depth. The cliay bed for the archaic city h'.'!d been Jaid directly on top of this, bur- ned layer; there was no tl'ace of an inter- vening seittlement. The three houses whic,\were cleared had all been destroyed at the same time by the same fire evidently a general conflagration that destroyed the the whole city, since its traces were found at the same level in an isoliated trench 70

m. to the west dug in 1955. The pottery in the burned houses was for the most plart fine polished ware of local fabric, varying in color from black to grey, buff, and reJ.

in many instances it was clear that the color had been changed in the second firing at the time of the destruction of the city. The variety of shapes was not great; the three predominant types were large round- bodied jugs with trefoil mouth, smallings with tall s,traight wall and round mouth, and small rounded trefoil jugs. Shallow bowl, s were found in great numbers in the southern house. These had been stacked for storage in wi0ker baskets in which they had been placed, bottom up, one on top of another, and the space around the stack within the basket had been filled by more bowls set on edge. Fig. 3 shows two s,uch stacks as found in the south house, and beside them at the left

the bottom of the wicker basket which had contained a third. üne such stack had been made up of thirty - six or more bowls. Th0 bowls, though they vary considerably in size, are es sentially the same in shape, with minor variations-plain or carinated rim, lise base or ring foot or pkin rounded bottom. The decorated pottery included a few vases of typical Phrygian painted ware: geometric designs and panels filled by animals or birds, in black on the buff c: ay ground (Ekrem Akurgal, *Phrygische Ku.nst*, "reifphrygis,ches Stil", Taf. 12, 14,

16). Vases of this style are dat.ed with so- me assurance at the end of the eighth and beginning of the seventh centuries; their presence in the Phrygian houses sugges:s a des,truction at about that time. The widespread destruction noted at Gordion at this level and to be dated in the first quarter of the seventh century immediately suggests föa,t Gordion was destroyed 'Jy a raid of the Kimmerians who, tradition telis us, brought down the Phrygian king- dom of King Mid:as at precisely that time. The archaeological evidence at Gordion seems to confirm the tr.adition to the full.

The houses of the Phrygian ,level, then, destroyed in the early seventh century, must have been built in the eighth. Various bits of technical evidence indicate that there were two and perhaps three building periods, and that the partiality excavated south house was later than th2 two to the north of it, so that these last may have been first built well baok in the eighth century. As we have not yet dug below their levels, we have no precise evidence as to how far back they are to be dated. But the three Phrygian houses to-gether give us a startling impression of the level of culture reached by their inhabitants by the end of the eighth century.

The e'.=istern house, built of kerpiç iand wood, faced toward ithe north, opening through two symmetrically placed door- ways to the 'large paved court within the city gate. it was divided initio two roomSi by a cross - wall pierced by a wide connecting

doorway (fig. 4). The smaller north room had a round hearth of fine hard plaster exactly at its center; the inner room, which could entered only from the outer, hiad a similar hearth which lay on its main axis, but somewhait to the north of it.s cross - axis. The outer 1100m was paved with a floor of pebble mosaic Sihowing geometric designs in dark blue and dark red on a white ground. This was preserved in very poor condition, but clear evidence of pratches and repairs suggest th:at it had a long period of use, and that it may not have been in very good condition at the time of the des truction of the house. The inner room had a floor of hard white lime plaster containing pebbles, but without design. The wallS₁ had been covered by a thick layer of fine lime plaster, probably white; but the heart of the destruction fire h:11d vitrified the plaster and in pliaces made it semi - liquid so that it started to run down. The roof had been of large beams of wood covered by a liayer of reeds coated outside with clay. Large pieces of charred wood and massers of burned reeds overlay the floor, and among the iliaitter were hiard - baked lumpsi of clay which bore the imression of the reeds over which the chy had been laid while soft.

The walls of kerpiç were three bricks in thic,kness (about 1 m.) and preserved to a uniform height except for the core cours,e which in places stood two or three layers higher than the facing courses. In

,the inner and outer faces of the wallsı were niche - like vertical grooves in which had been bedded wooden posts. The piers be- tween these postsı, rising uniformly to the same height (nine courses of kerpiç, about 1 m.), had been surmounted at that level by horizontal wooden beams lıaid in bo% faces of the wall.:1. The •kerpiç wall was thus r,trengthened by a framework of wooden posit.s and beams in its inner and outer faces, and these had been tied together at intervals by crosspieces running through

the thickness of the wall. Since no nails of iron or bronze were found, it would seem

that this woodwork must have been joined by an ekiborate system of mortises. The good lime plaster on the inside concealed the wooden framework as well as the ker- piç walls; on the outside there was evi-dently a coat of clay or mud stucco. The quantities of wood use,d added greatly to the intensity of füe fir.e that dest:rioyed tlte buil,ding; the walls are preserived uni - formly to the height of the lowest horizon- tal beam, for when that burned out the wall f.1ces above, reSiting on it, collapsed with the exception in some places of the core of pure brick, which remained to a height of two or three more layers. If we may surmise that the horiz, mta.1 beam courses were spaced at regular intervals of nine courses (about 1 m.), we may suggest a minimum height for the walls of three bands of brickwork (3 m.) .separated by two beam courses each about 30 cm. in thickness (three courses of brick), with perhaps a third beam on to1>-a total of approximately 3.90 m. 'The lavish use of wood in this building suggests that an abundant supply was available locally; and the elaborate s,ystem of mortises by which it must h:1ve been held together indicates that. the Phrygian builders were first-rate carpenters.

The west Phrygian house, sepa.rate<1 from the first by a. narrow alley or passa- geway, •also faced toward the north and fronted on the paved court inside the city gate. Its walls, however, were made not of kerpiç but of ;9. soft Umes, tone or poros, with inner and outer faces of good squar€d blocks and a core of rubble between. These stone walls too were reinforced by a frame- work of wooden posts and beams (fig. 5). They were about 2 m. in thickness and the two faces must have been tied together b r cross - pieces running through, though the walls1 were nowhere preserved well enough to show cl€1ar evidence of these. The inner walJ faces had been coated with good white lime plaster in at least three layers; the ou- ter faces sieem to have been left exposed. The roof, of which the debris overlay the floor,

was similar to that of the kerpiç building: of wooden beams and reeds, covered by an outer layer of clay.

In plan the western house consisted of a porch or vestibule at the front, and a large entered only through a inner room doorwly opening from the vestibule. At either side of this doorway lay a shaUow niche - Iike room or closet, entered from the vestibule but with its f.loor at a slightly higher of Much the charred wooden level. framework of the doorway and of the step from the vestibule to the closet at the east side had held its shape well enough 1..o suggest a resiloration of tlıc wooden tentative construction. The north side of the building has not yet been entirely cleared; but here the wall between the vestibule and the court outside seems to have been only 32 cm. in thickness-the widtlı of one brick-and can have been little more tihan a screen, rising perhaps only part - way to the height of the roof, which in consiequence must have been supported by piers or wo0- den posts in antis. In plan the bui:1,ding thus seems to have been of the megaron type; and, also in conformity to that type, the large inner room had, a round stucco hearth on its main axis, though somewhat to the north of center. This room, measuring

10.84 by 9.73 m., was pa:ved throughout (except for the hearth and an oblong area 1t the southeast corner) with a floor of pebble mosaic well enough preserved to show that there were no interior supports for the roof. The designs, in dark blue and d1rk red pebbles on a white ground, are a scatter of geometric motives; there is no overall design fitted either to the room a.s a whole, or to the circular hearth near it<, center. Thes,e designs1 (fig. 5) include checkers and lozenges, crenelations and swastikas, and spoked wheel - like circles as we11 as l,arge circular rosettes. The ves-tibu1'e and the niche - rooms opening from it were also floored with pebble mosaics.

Along the whole leng,th of the east wall of the building outside had been set

This was evidently stucco. for accommodation of people waiting outside füe building, perhaps to see the king or whoe, ver received inside. In any case these idlers covered the face of the wall with drawings, made perhaps to while away the time of waiting. In many caSies later dra- wings have been superimposed over earlier ones. Most were found on blocks faHen from the east wall: but at its south end some of the blocks of the "piens" between the "niches" which held the wooden posts were still in place, and one of these (fig. 6) sihows the figure of a dancer. Many other blocks were found as they had fiallen from the east wall, adorned with crude drawings of the eighth century Phrygian scene. üne (fig. 7), which shows two warriors fighting, is a palimpsest; in front of the warrior at the right may be secm the remains of an earlier drawing, the rump and hind legs of an animal going to the right. Another (fig. 8) is of the grea- teE1,t interest because it shows the facades of two eighth century Phrygian houses such as its maker was used to see: houses with gable roof s surmounted by curved a.croteria very like the rock façades of Phrygian Yazıhkaya or Midas City. These drawings suggest a gabie roof for our megaron, which had a clear span of just un- der 10 meters (973m.).It is diffcult to un-derstand how this could have been covered by a gable roof without the use of trussed construction. In the absence of any direct evidence for a knowledge of such construc- tion at this early date, we may point out the indications that suggest it at Gordion: a plentiful supply of large timber, great skill on the part. of the builders at ciarpent- ry and especially in mortising, and, in the megaron, side walls of sufficient thickner>s (2 m.) to bear the lateral thrusrt of a truss rnof. But whether or not trusses were employed, a funther indication that our megaron was covered by a gable roof is given by a voluted block of poros which was found reused in the rubble bedding of,

a ledge or bench of stone, covered with day stucco. This was evidently for the accommodation of people waiting outside füe building, perhaps to see the king or whoe,ver received inside. In any case these idlers covered the face of the wall with drawings, made perhaps to while away the time of waiting. In many caSies later drawings have been superimposed over earlier ones. Most were found on blocks faHen from the east wall; but at its south end some of the blocks of the "piens" between the "niches" which held the wooden posts were still in place, and one of these (fig. 6) sihows the figure of a dancer.

!ay dillectly beneath the place of its reu-;e. Together with the acroterion were found two l, arge lion heads of poros (fig. 9) evi- dently made to decorate the facade of a building and with tongues behind to be set into the thickness of the wall. These also had most probably formed part of the de- coration of our Phrygian megaron.

The east and west Phrygian houses have been referred to as megara. An characteristic of the type is that the megaron should be a freestanding unit; and bo,th our Phrygian houses were free- standing units at the time of their original construction. Although only the east and part of the north sides of the western buil- ding have been cleared enough has been exposed at ,the south and west to show that these walls too were covered by scratched graffiti. A stone wall of Phrygian times built against the east w.all of the east house can be shown to be a lat.er addition because the outer face of the house wall had been covered with clay stucco, proving it to b,:! earlier. The laster addition of the house to the south blo0ked off the alley or passage between the two earlier buildings and made it useless for circulation; this space, toget- her with a narrow area to .the south of the east house, was then conver'ted into st.:>rerooms by the addition of cross - wa:lls. These storerooms, having no doors, must have been entered from above. They con-tained large storage jars and wicker ba!::,- kets which had been fuH of wheat and

b:1.riey; qu:'.mtities of these cereals were found in a charred condition from the fire (fig. 10).

The richness of the Phrygian houses with their ample proportions, sculptured decoration, and splendid mosaic floors 1:mggests that they were not mere private dwellings. More likely they were parts of a palace complex: not a single bui, lding of many rooms, but a number of separate units within a compound surrounded by a wall. More excwation to west and south will give further material, but in t!ie meantime these are the first samples of real Phrygian architecture to be known. They are astonishingly advanced, and at the same time highly traditional; but the tradition is not but rather thett of the north and west where the megar'In had flourished from the bronze age. The architectural evidence would seem to con- firm the linguistic indications and the literary traditions that the Phrygians came to Anatolia from Thrace and the Balıkans.

THE CEMETERY

Six tumuli were dug in füe cemetery to the east of the city.]in two no buria,1 was found (one had covered a cremation); in three the graves had already been robbed in ancient times. The sixth, a small tu- mulus about 12 m. in height closie to the biggest tumulus at the southeast, covered

:1 very rich burial of Phrygian times. The position of the grave had been determined beforehand by a succession of driHings which showed the and extent of the pile of stones location normally heaped over a wooden Phrygian chamber tomb. The chamber itself waSı more precisely located because of an empty space above it left when its wooden roof caved in, carrying down the stones piled over it. The overlying tumulus was m1de of hard clay which a wooden table with a painted top, and did not fall at that time. The roof of the grave perhaps a second table beside it at the west. In chamber was of large squared • beams laid in the southwest had stood a large chair or a double layer, the lower across the width of throne of wood, elaborately inlaid, with the chamber, the upper al:ong its

length, with a single beam on top at the center (fig. 11). The roof meas, ured 6.40 m. in length (east - west) by 5.25 in width. Near its center was found the stump a vertical wooden mast s,et up, no doubt, at a centering to guide in the piling up of the tumulus earth. The hole left by the decay of this mas,t was detected at a depth of only 2 m. below the surface, and could be followed right down; the stump of the mast it:1elf may be seen in the picture (fig. 11) b2side the overlying central roof bea:ın. The mist had stood some five or six meters to the southwest of the present peak of the tumulus: unless the shape of the mound has been greatly modified in the course of time by wind and erosion, which seems unlikely, the position of the ffifü;t to the peak would suggest with relation that the tumulushad been deliberately made in such a way tihat the grave did not lie at its eX!act center.

The chamber itself was constructed of squ1red timbers mortisied together at the corners. It measured instde about 4.5 by 3.5 m., with a height from its floor of about 1.50 m. Evenly spaced pegs set into notches in the walls all around juSit below the ,roof level suggest that the timber construction had been masiked with hang- ings of doth, since shreds of gauze - like fabric still adhered to the ends of several. The chamber seems further to have been furnished like a room. Along .the north wall stood: 1. bed, with its head against the west wall: three legs found stiH in place against the walls suggest its approximate dimensions of 2.30 by 1.10 m. Near the foot of the bed had been a small table with an elaborately inlaid top of wood of con- trasting colors. Beside this and near the center of the chi.mber stood a kirge brome c:rnldron resting on a tripod of iron. Agains, the south wall had been perhaps a second beside it. Ali of theine

furnishings had ,been badly smashed and crushed by the collaps,e of the roof and consequent inrush of stones from above; but approximate positions of the items enumerated abov,e are fixed, and it may be possible after study to suggest restor:a.tions from the friagments that have survived. Other furnishings of wood-footstools, small three- and four-legged table tnay,s, large platters, and a wooden chest- had been so broken and tossed about that their original positions are a matter of conjecture. The entire easit end of the chamber was filled up with large co:arse vessels which had probably contained offerings of liquid food, while the north side held many round - bodied deep bowls (many of which must hia, ve been under the bed) perhaps with offerings of solid food (fig. 12). Overlying these were a belt of bronze, finely engraved and with a lining of leather, and a number of bronze fibulae. These had be€n the per.sonal adornments of the dead, and from their position as well as in the absence of any trace of a wooden coffin, we must assume that the body had been laid out on the bed as on a bier. Of the skeleton only the enamels of several teeth were found; these were identified by Professor Muzaffer Şenyürek as those of a child four to five years old. The belt, with a length of about 52 cm., would fit ad-mir:ably a child of that age.

The bronze cauldron at the center of the chamber contained a number of smaH wooden animals and utensils which may have been the playthings of the child while it w:1s alive. Fig. 13 show,s the cauldron pa:rtiaHy cleaned; in it may be ,seen a group of a lion attacking a bun (fig. 14) resting on a small wooden saucer with openwork handles (fig. 15). Other animal figuTes found in the cauldron were two lions (of differing types), an ox with a yoke, a running deer, a horse decorated with con-centric circles and reminiscent of the bronze animals inlaid with silver from tlie graves Alacahöyük, and a winged hor- selike creature eating. Among the utensils

in the cauldron were saucers with open-work handles, spoons, a dipper, and small wooden box with carved rosetite decorations.

Most of the offerings in the grave ha<1 evidently been placed on the tables a.Jong its south wall. Vessiels of pottery and of bronze were found in large numbers along the south side of the chamber, and In various positions as they had fallen on the collapse of the roof and the crushing cf the tables on which they had rested. "The bronzes included three deep :bowls with ring handles (two in fig. 1.6), two jugs with tref.oil mouth and handles made s.€- parately and .attached by rivets (fig. 17), two dippers or ladl,es of which one, found broken in fragments, had a spoked < lise above the bow.J. ornamented with engraved decoration, and a double handie ending in a bird's head (fig. 18), anda number of omphalos bowl:s. in one of these had been placed ... shallow glass bowl of similar shape, ribbed outs,ide. The most pretentious of the omphalos bowls was decorated with a raised design of pertials and blobs (fis.

19) raised on the outside, hollowed within but as it would seem made by casting rather than by hammering (repousise).

The pottery was of three fabrics,. The first, the normal .painted Phrygian ware familiar from Koerte Tumulus III, is a buff ware decorated with geometric designs in matt black p:aint. A jug with rote! Ies at the top of the handle (one of three) shows bulls and lions in panels on the body, deer and antelope in panels on t!ie neck (fig. 20). The auxiliary ornament of checkerboard, dotted net pattern, lo- zenges, and concentric rings is typicaDy geome'tric and Phrygian. Two other vesisels of the s1me fabric (fig. 21) are in the form of large birdsgeese-with holes for filling in their backs1 and for pouring through their bills. The painted decora- tion is of the same geometric genre, but adapted to the sh'.: l,pe of the vessels tu outline the wings, to create the illusion of feathers on the breasts, and perhaps in

the wavy lines which cover the lower par;; to suggest the water on which real geese spend much of their time.

The second fabric, represented by four vessels, is a red warie with a h:ard shiny surface on which the designs are drawn in a mat,t greyish paint. üne of tihe black on 'red ware vases (fig. 22) is in the shape of a ram with curly horns, like the geese with a filling hole in the middle of the back and a pouring hole through the snout. The body is covered with geometric decoration. A second vessel of the same f::ibric is a small round - bodied lekythos, in shape and decoration identical with many similar vess, els of Cypriot Iron Age ware. Tihis may have been an import from Cyprus; if not, it was certainly made under Cypriot influence.

The commonest fabric represented b the black - polishied ware tomb was tihe which we take to have been locaHy made. The vessels of this ware found in the tomb included trefoil mouth jugs, a ring vas,, two spouted bowls1, and a number of sievespouted jugs, The most original of the::1e is a vase in the shape of a goat, the horns and tail curved to ser.ve as handles, with a filling - hole in the middle of the back (fig. 23). A hole tihrough the mouth serveid for pouring. Around the neck is a double row of incised rings, suggesting a collar. The pottery from this burial finds many parallels among the Via.ses from Koerte Tumulus III. It also finds close pa-mllels among the vases found in the bur- ned houses on the city mound, esspecially in the painted Phrygian (black on buff) and the black polished wares. These paralleis indica,te tihat there cannot have been a very great laps, e of time between the ma-king of the tomb and the destruction Of the city. The richness of the tomb would seem to preclude its having been made after what seems to have been a general catas, trophe; have been maide in the must therefore laSit yea'l"s of the Phry- gian Kingdom, before the coming of the Kimmerians. probably safe in d:1-

ting it al-ound 700 B.C., just before the destl'uc;tion; and this dating for our tomb serves to confirm the similar dating, already fairly generally accepted, for,the contemporary Koerte Tumulus III.

The most astonishing of the contents of the new tomb are the fragments of the great chair or throne which stood :at the southwest corner. It was made of boxwood elaiborately inlaid with a darker wood, yew. A large part. of the back was found still ho!ding together in one piece, though maide up of many separate elements fastened together by tongues and pegs (fig. 24). Tihe channels for the inhy had been maile by drilling holes close together in 1-ows, then cutting away the wood between the drill - holes; the inilay, cairefully fitited, was probabl; y held in place by glue. The designs are entirely geometric. The chance of fin- ding objects, of perishable materials like wood is rare enough in itself; the exquisite craftsmanship and masterly design of the wooden throne from the Gordion tomb gives us for almost the first time outside of Egypt an inkling of what had been achieved by workers in materials which through their perishable nature have not survived. The inlaid throne and other ob- jects of wood, as well as the vessels of pot ery and bronze, were all surely made locally at Gordion or in considered Phrygia, hitherto a rather harha.rous backwater. The objects in füe tomb which had been im- ported were the glass bowJ. and three sma!l vessels of blue faience, aiU probably of oriental origin. The small lekythos mentio- ned above, if not :itself an import from Cyp- rus at least showing Cypriot influence, is, further evidence for oriental connections. No imports or influences from the west were apparent. The Phrygbm geoo:netric system of decoration, applied alike to pot- tery, woodwor,k, bronze engraving, and mo- saic seems to be a style in itsielf quite inde- pendent of contemporary Greek work and uninfluenced by it. A geometric style of decoration and a western or northern style of building seem to have been a part of the

TÜRK ARKEOLOJİ DERGİSİ VII - 1

tradition of the Phcygians, brought with them |C€ntury, and suggested the direction from when they entered Anatolia and de-veloped independently by them there. The excavation at Golidion has shown the asto- nishingly high level of material culture they had attained by the end of the eighth

which they came. More and deeper digging may throw some light on the problems of how and when the entered Anatolia, an,i show the various stages in the development of their culture after their arrival.

195-6 GORDÍON HAFRÍYATI

Pensilvanya Üniversitesinin Gordion'- daki yangın yığıntıları arasıında bir iskelete 19'56 mevsim çalışması üç ayrı kısım- da yürütülmüştür: esas höyükte, bunun güney batısındaki daha küçük höyükte (Küçük Höyük), ve mezarlıkta. Buna ilave olarak mezarlık arasından geçen eski yolda da araştırma yapılmıştır. 6,25 m. genişli- ğindeki bu yolun, her iki tarafı, iri taşlaı:- la döşeli, orta kısmı sıkıstırılmış çakılı yapılmıştır (Resim: 1). T, ümülüsler ara - sından geçtiği için tümülüslerden ve doh- yısiyle Post Frig devrinden daha sonradır. Belki Pers veya Roma devrinden birisine aittir. Roma devri yollarından daha kaba ve yapılışı bakımından da ayrıdır. Doğuya doğru eski bir yerle:şme yeri bulunan Beyceğiz'de ve Yeni Doğan İstasyonu ya- nındaki Kara Höyük yakınımda bu yola ait bazı izlere tes.adüf etmek mümkündür. Gordion Höyüğünün kuzeyinden geçerek, modern demir yolunun gectiği Porsuk va- disini takip olmalıdır. İhtimal bir kol şehrin altından, Sakarya'yı köprü ile geçerek şehir kapısına doğru uzanıyordu. Roma devrine ait önemsiz şehirleri biribiri- ne bağlamasından dolayı, Pers devri Kıral yolunun bir kısmı olmalıdır.

KÜÇÜK HÖYÜK

Esas höyüğün güney batısındaki Küçük Höyük, eskiden esas höyükten Sakarya'nın bir kolu ile ayrılmış olmalıdır. 19152 senesinde yapılan araştır - ma, burasının eski bir yerleşme olduğunu ve altınc,1 asıra ait bir tümülüsle beraber üzerinin toprakla kapatılmış olduğunu göstermiştir. Tepenin güney tarafında açılan bir yarmada ağaç konstrüksiyonh:, kerpiçten yapılmış büyük bir yapının bir kı-smına r'.'lslanılmış, ve burasının bir harp neticesinde yangınla tahrip edildiği görül- müstür. Kerpiçler üzerinde tunç ve demir ok uçlarına ve çökmeden meydana gelen

raslanılmıştır. Bulunan çanak çömlek araernda, .a.şağı yukarı M. ö. altıncı asrın ortalarına tarihlendirilebilen birçok Lidyonlar ve Lidya tipinde lekythoi ve skyphoi vardır. Netice olarak yı ılışı M. Ö. '547/o senesinde Sart'ın zaptı ile nihayet ıbulan Cvrus ve Croesus arasındaki muharabe ii tefsir edilebilir.

1956 da yanmış Lidy.a. evinin altında, stratigrafik yerleşme tabakaları bulmak ümidiyle çalışılmıştır. Neticede Küçüık Höyük'ün orta kısmının tabii bir tepe olduğu anlaşılmışt-ır. Bu yapı, tamamen kerpiçten yapılmış bir platform üzerine inşa edilmiştir. Platforma ait kerpiçler evin taban se-•viyesinden 12 m. derinliğe kadar devam etmektedir. Genişliği 8,5 m. dir. Batı ke- narı 20 m. uzunluğa kadar takip edilebil - miştir. Platform'a güneyde yine kerpiçten yapılmış bir rampa ile çıkılır. Yapı tahrip edildikten sonra tümülüs inşa edilirken, her ta.rafı toprakla kapatılarak y:ükseltil - miştir. Bunun doğusunda yanmamış tunç ve demir ok uçlarının bulunduğu yapıı da aynı şekilde toprakla ıkapatılmış olup, bel- ki muharebe esnasında bir müdafaa kastı ile insa edilmiştir. Bu hususa 1957 deki çalışmalar daha fazla bilgi verecektir.

HÖYÜK

Gordion'daki iskanda Frig şehrinin tahribi ve Perslerin gelişi arasında kalan 150 senelik bir hoşluk vardır. Bu, sadece Lidya devrine ait yanmış yapıda değil, ay- nı zamanda M. Ö. altıncı a.sır başına vedinci asıra tarihlenen zengin mezarlarda da görülebilir. Esası şehirde de bu devire ait yerleşme bulunamamıştır. Arkaik şe- hir, büyük bir yangınla tahrip edilen, Frig şehri harabeleri üzerine yığılmış, kalın bir toprak tabakası üzerine oturur.

1956 da arkaik tabakalar kaldırılıp,

Frig devrine ait yapılar üzerinde çalışıl- mıştır. Bu tabaka, evvelki senelerde açığa çıkarılan güney doğudaki monümental şe- hir kapısının karşısındadır. Burada eskiden şehir kapısına kadar devam etmiş olması muhtemel üzeri acık. tas döşeli geniş bir avlu bunun.önünde, güney kısma doğru uzanan iki Frig yapısı vardır. Daha sonra inşa edilen bir duvar doğrudan doğruya bu taş döşeme üzerine oturmaktadır. Her iki bina ve bunların güneyindeki bir ev kıs - men kazıılmıştır. Arıkaik devrin toprak dolması, doğrudan doğruya Frig devrini.n yanmış yığıntıları üzerine oturur. Arada bir iskan izi yoktur. Her üç y.aptda büyük bir yangınla tahrip edilmiş olup, bu yangm bütün :sehre samildir. 195,5 de yapılan bir kazıda buradan 70 m. uzaklıktaki bir sondajda .3Jnı yangın rasJanılmıştır. Yanmış evlerde bulunan çanak çömlek ye - li olarak yapılmış, perdahlı, siyahtan griye ve soluk pembeden kırmızıya kadar deği - şen muhtelif renklerdedir. Esas renklen yangından ötürü değişmiş olup, şekil zen- ginliği fazla değildir. Üç hakim kap tipi vardır:geniş, yuvarlak gövdeli, yonca ağızlı testiler; küçük, düz gövdeli, yuvarlak ağız 1 testiler; ve küçük, yuvarlak gövdeli, yonca ağızlı testiler. Güneydeki evde sepet- ler içine yerleştrilmi§ tabaklar çok bulun- muştur (Resim: 3). Frig tipi boyalı kap- lar üzerinde geometrik desenlere, kuş ve hayvan motifleri ile süslü panellere raslıı- nılmıştır (E. Akurgal, Phrygische Kunst, "reifphrygisches stil", taf. 12, 14, 16). M.

Ö. sekizinci asırın sonun1 ve yedinci asrın başına tarihlendirilen bu tip kapların burada bulunuşu evlerin tahribinin aşağı yukarı bu devire rasladığmı gösterir. Bu tabakaya ait, bütün höyüğe şamil tahrip ise M.Ö. yedinci asrın ilk çeyreğine aittir. Bu, bize Gordionun Kimmeriler tarafrın dan tahrip edildiği fikrini vermektedir.

M. Ö. yedinci asrın başında tahri) edilen bu Frig evleri sekizinci asırda inşa edilmiş olmalıdır. Muhtelif yerlerdeki ka- zılard:;tn elde edilen bilgiye göre iki, belki ele üç yapı katı vardır. Güneydeki ev, ku- zeydeki iki eve naz.1ran daha sonra inşa

edilmiştir. Bu vaziyete göre kuzeydeki sekizinci asıra kadar yükselmektedir. Daha derin tabakalar araştırılmadığından ne ka- dar es,kiye gidilebileceğini söyliyecek du - rumda değiliz.

İki odalı, kerpiç ve ağaçtan inşa edil- miş doğudaki ev kuzeye, taş döşeli avluya açılmaktadır (Resim: 4). Kuzeydeki kü- çük odanın ortasında yuvarlak bir ocak vardır. Aynı ocağın bir eşi içteki odada da görülür. Dıştaki odanın tabanı, ufak çakı - lardan yapılmış, beyaz zemin üzerine koyu kırmızı ve koyu mavi geometrik desenli mozayikle ıkaplıdır. İçteki odanın tabanı ise desensizdir. Duvarlar kalın beyaz sı - valıdır.

Duvarlar üç kerpiç kalınlığındadır (a<;.1ğı yukarı 1 m.). İç ve dış kısıımlarda ağaç yerlerine ait nişler vardır. İç ve dış- ta dokuz kerpiç yüksekliğindeki (aşağı yu- karı 1 m.) yatay ağaçlar iç ve dıştan bir- birine duvar kalınlığınca devam eden eğaçhrla bağlanmıştır. Şimdiye kadar tunç ve demir çivi izlerine raslanılmam1ş - tır. Duvar yükseklikleri ilk yatay ağaç yerlerine kadar korunmuş olup, esas yük - sskliği bu ağaç sıralarına göre en aşağı 3,90 m. dir.

Batıd1ki Frig evi birincisinden ufa'.-: bir aralıkla ayrılır. Aynı isıtikamette ku - zeydeki taş döşeli avluya açılır. Duvarları- nın iç ve dış yüzleri kesme kireç taşından yapılmış, araları düzensiz taşlarla doldu- rulmuştur. Bu taş duvar da dikme ve yatay olarak konulmuş ağaçlarla takviye edil - miştir (Resim: 5). Bunlar duvar kalınlı- ğınca devam eden ağaçlarl,a iç ve dıştan birbirine bağlanmıştır. lç yüzü beyaz sıva- lıdır. Çatı kısmı her ikisinde de ağaç ve kamıştan yapılmıştır. Batıdaki evde önde revak §eklinde bir kısım vardır ve buradan bir :kapıı ile geniş bir iç odaya geçilir. Me- garon planlı bu evin büyük odasının orta- sında yuvarlak bir ocak vardır. 10,48X9,,73 m. eb1dındaki odanın ta- bam mozayikle kaplı olup, tavanı tutacak bir dikme izine tesadüf edilmemiştir. Mo- zayik koyu mavi, koyu kırmızı ufak çakıi- lardan yapılmış beyaz zemin üzerine geo -

iyi korunmuştur (Resim: 5). Doğu duvarının dıs yüzü, taslar üzerine oyma oları:..i. { yapılmış resimlerle kaplıdır. Bazan birbiri üzerine yapılmış olanlarına da raslanıt. Orijinal verlerinde duranlardan bir tanesinde danseden bir sahısı (Resim: 6), diğerinde kavga edenler (Resim: 7), sonuncusunda seikizinci asır evlerinden birinin önden görünüşü (Resim: 8) görülmektedir. Yazılıkaya'daki kayalar üzerine yapılmış evlere benzer. Büyük bir ihtimalle mega ron evinin cephesini süsliyen, ta§tan yapılmış aslan başları (Resim: 9) ve volutlar (AJA 60, 1956, Pl. 93; fig. 4'1) bulunmuş-

Doğudaki evin doğu duvarı karşısı,ı- da, devrinde fakat yapılardan muahhar olarak inşa edilen bir duvar vardır. Her iki ev arasmda:ki geçit bu duvarın inşasından sonra depo odaları haline getirilerek kullanılm1ya devam etmiştir. Kapı olmadığından bu depo odalarına yukarı dan girilmiş olmalıdır. Burada büyük küpler, buğday dolu sepetler bulunmuştur (Resim: 10).

bulunan zengin eşya bunların basit bir evden çanak - lar vardır ki, bunların mühim bir ziyade hususi y.1pılar oldugöstermektedir. Daha zivade, duvarla çevrili, musta:kil birçok ya.pı - lardan Ölünün şahsi .süs eşyası olarak deri üzerine meydana gelmiş bir sarayın bir kıs- mı gibidir. yapılmış üzeri kabartma süslü tunç bir kemer llerde batı ve güneyde yapıla- cak kazılar daha ele geçmiştir. Bunların va- ziyetinden ve fazla malzeme verecekse de, bunlar şimdiye tabutun bulunmayışından ölünün bir karyola kadar ,bilinen Frig mimarisinin örnekleridir. Şarklı olmayan fakat kuzeyde ve ait yalnız dişle- rin mine kısımları bulundu. batıda Tunç Devrinde! 1 beri megaronun Prof. M. Şen- yürek bunların 4 - '5 yaşında tekamül ettirildiği bir ananeyi gösterir. Mimari bir çocuğa ait olduğunu tesbit etmiştir. 42 cm. vesikaların, dil vesikaları yanında, Frig'lerin uzun- luğundaki kemer de ancak bu y.1ştaki Anadolu'ya Trakya ve Balkanlardan geldiğini bir çocuğa uygun gelmektedir. göster- mektedir.

MEZARLiiK

Sehrin doğusundaki tümüliüs kazılmıştır. Birincisi yaıkm.-ı mezar ağaçtan yapılmış ufak bir tabak üzerinde olup, ilk ikisinde iskelet bulunma - mıştır. Üçü durmaktadır eskiden soyulmuştur. Altıncısı büyük tümülüs içerisinde bulunan, birbirinin aynı iki aslan, yakınında ve 12 m. yüksek-

metrik desenlidir. Evvelkine nazaran daha liğindedir. Burada mezarın yeri, sondaj makinesi ile tesbit edilmiştir. Mezarın üze- ri dört köşe ağaçlarla. iki sıra halinde kapatılmıştır. Alttaki sıra mezarım genişliği, üstteki sıra mezarın uzunluğu istikametindedir (Resim: 11). Çatı kısmının dışta 1 doğu batı istikametindeki uzunluğu, 6,40 genişliği 5,25 m. dir. Mez.arın içini!ı ebadı ise 4,5X3,5m.dir. Yükseklik 1,5 m.dil'. kısmının kumaşla kaplıı olduğunu göste- ren izlere raslanılmıştır. Kuzey duvarı boyunca konulmus, bası batıda olmak üze- re bir karyola vardır. Üç ayağı orijinal muhafaza eden kuyolanın ebadı 2,30Xl,10 m. dir. Ayak kısmı yakınında kakmalı bir masa vardır. Bunun yanında ve mezarın ortasına yakın kısımda üç ayak iizcrinde duran bir kazan yer almaktadır. Güneydeki yanında bir ağaç masa ile güneydeki •köşede üzeri kakma ve oyma işlemeli bir sandalya veya taht bulunmak- tadır. Bütün mobilyalar üzerindeki çatı - nın ve bşların çökmesi ile kırılmış ve Ezilmiştir. Mezarın içinde ve doğu kısımda içi akıcı bir yemekle dolu olması muhtemel kaba kaplar ele geçmiştir. Kuzey tarafta ise muhtemelen akıcı olmayan Mozayik döşeme, heykel parçaları ve içlerinde yemeklerin konulduğu yuvarlak gövdeli derin ğunu kısmı

> etrafı bir y.9.tak altına konulmuş olmalıdır (Resim: 12). ilk üzerine yatırıldığını tahmin ediyoruz. İskelete

Mezarın ortasında duran tunç bir ka- zrn içerüiinde çocuğun hayatta iken oyna- dığı ağaçtan yapılmış küçük hayvanla. vardır mezarlııkta afü tane (Resim: 13). Boğa ile mücadele eden bir aslan (Resim: 14). Aynı boyunduruk ve öküz, koşan

at vardır. Sonuncusu Alacahöyük me zarlarındaki gümüş kakmalı tunç hayvan-ları hatırlıatır. Ağaç bir t3'bak, bir kepçe ve kaşıklar, üzeri oyma rozetlerle süslü bir kutu da aynı kazan içerisinde bulun - muştur. Görünüşe göre ölüye takdim edi - len eşyaların çoğu güney duvarıı boyunca uzanan bir masa üzerine konulmuştur. Piş- mi-1 toprak k1plar ve tunc kaplar mezar odasının günev kısmında bulunmuştui'. Tunç olarak halka kulplu üç derin çanak (Resim: 16), iki testi (Resim: 17), iki maşrapa, hamam tasları, üzeri oyma süs-lü bir disk vardır. Tunç hamam tasl:arın - dan birisinin içinde camdan yine hamam tası şeklinde bir kap bulunmuştur. Hamam taslarinin kabartma süslerinin kabarık kısımları dış.9. gelmek üzere işlenmiştir (Resim: 19). Döverek yapılmadan ziyade, dökme olara,k yapılmış hissini vermekte - dk

Çanak çömlek üç ayrı tekniktedir. Birincis,i Koerte Tümülüs III. de tanıdığı- mız normal boyalı Frig kaplandır. Mat si- yah boyalı, geometrik desenlidir. Bu gruba giren bir testinin gövdesi üzerine aslan ve boğalar, boynu üzerine ise geyik ve anti- loplar yapılmıştır (Resim: 20). Dama tah- tası, kafesler, mainler ve aynı merkez i daireler tipik geometrik Frig tarzındadır. Aynı tipteki iki vazo (Resim: 21) kaz şeklindedir. S,ırtındaki delikten doldurulur ve gagasında.n akıtılır. Desenler geometri!:: olup, vazonun şekline uydurularak kanııt tarzında yapılmıştır.

İkinci tiptekiler dört vazo ile temsil edilir. Kırmızı, parlak satıhlı olup, desen- ler mat gri boya ile yapılmıştır. Kırmızı üzerine siyah olan bir tanesi (Resim : 22) koç şeklindedir. Bu tipin ikinci kabı küçük, yuv.1rlak gövdeli bir Iekythosdur. Şekli ve süsleri Kıbrıs Demir Devri kaplarına ben- zer. Bu kap Kıbrıs'tan ithal, ithal değil:;e bile Kıbrıs tesiri altında yapılmıştır.

Üçüncü tiptekiler siyah perdahlı kap- lar olup, bunların yerli olarak yapıldığını kabul ediyoruz. Bu gruba giren yonca

bir geyik ve aynı merkezli dairelerle süslü bir at vardır. Sonuncusu Alacahöyük me - vazo, iki emzikli :kase, ve süzgeçli, emzikli zarlarındaki gümüş kakmalı tunç hayvan- ları testiler vardır. Bu grubun en g,üzel örneği boynuzu ve kuyruğu kulp şeklinde kıvrı - mış kaşıklar, üzeri oyma rozetlerle süslü bir kutu keçi şeklindeki kaptır (Resim: 23).

Bu mezarda bulunan kapl'arın birçok benzerleri Koerte III. tümülüste ve höyük- te yanmış evde bulunmuştur. Bu bize me- zarın yapılışı ile şehrin yıkılışı arasıında büyük bir zaman fıarkı olmadığını göster- mektedir. Bu yüzden Frig Kırallığının son senelerinde ve Kimmerilerden evvel M.ô. 700 tarihinde inşa edilmiş olmalıdır. Koer- te III. tümülüs için de bu tarih umumiyetle kabul edilmektedir.

Mezarda bulunan eserler arasında enteresanı tahttır. Şimşir ağacından yapılm1<1, daha koyu renkteki Porsuk ağacından k1kmalarla süslüdür. Tahtın arka kısmına ait ele gecen büyük bir kısım avrı avrı parçalardan yapılmış birbirine geçme ola- rak ba.ğlanmıştır (Resim: 24). K•akmalar- la eras kısım üzerinde açılan yataklar bir- birine çok güzel uydurulmuş belki tutkal veya zamkJıa yapıştırılmıştır. Desen tamageometriktir. Taht diğer eşya gibi (tunç ve pişmiş toprak kaplar) Gordion- da yerli olarak yapılmıştır. Cam hamam tası ve üç küçiik fayans kap ithal ve belki merkezlidir. Elimize geçen eserlere göre batıdan ithal vey:a tesir görülmemek- tedir. Mozayikler, ağaçlar, tunç eşya ve çanak cömlek üzerinde görülen geometrik desenler cağdas Yunan tesiri altında kal- madan yapılmış ve tatbik edilmişlerdir. Geometrik tarzdaki süsleme ve batı veya kuzey tarzındaki yapıları Friglerin anane- lerinin bir kısı olup, Anadalou'ya gelir- ken bu ananeyi getirmişler ve kendileri tarafından inkisaf ettirilmistir. Gordion'da yapılan kazı M.ô. sekizinci asır sonundaki smatın yüksekliğini ve Friglerin Anado- lu'ya hangi istikametten geldiklerini açık- lamıstır. Daha derin ve genis kazılar, Friglerin Anadolu'ya ne zaman ve nasıl geldikleri problemine ve geldikten sonra kültürlerinin tekamülündeki muhtelif safhalara ait, yeni ış,ıklar serpecektir.
